

Problem 2: Sum a Range

Name: _____

Function to write: `sumRange(start, end)`

Write a function `sumRange(start, end)` that returns the sum of every integer from `start` to `end`, inclusive, using the accumulator pattern.

- Declare a total variable before the loop: `let total = 0;`
- Add to it each pass: `total += i;`
- This "start at zero, add every pass" shape is the accumulator pattern — you'll reuse it constantly

Test Cases — fill in the expected output before you run your code

#	Call	Expected Output
1	<code>sumRange(1, 5)</code>	
2	<code>sumRange(1, 100)</code>	
3	<code>sumRange(4, 4)</code>	

HINT

If your total comes out wrong by one number, check whether your loop condition should be `<=` instead of `<`.
