

Problem 5: Multiplication Table

Name: _____

Function to write: `multiplicationTable(n)`

Write a function `multiplicationTable(n)` that returns a string showing the multiplication table from 1 to `n`, one row per line (rows separated by `"\n"`). Each row shows `n` products separated by spaces.

- The outer loop picks the row number
- The inner loop builds that row, one product at a time
- Build each row as its own string, starting at `""` before the inner loop runs

This needs a loop inside a loop (nested loops). Add each finished row to your overall result before moving to the next row.

```
console.log(multiplicationTable(3));  
// "1 2 3\n2 4 6\n3 6 9"
```

Test Cases — fill in the expected output before you run your code

#	Call	Expected Output
1	<code>multiplicationTable(3)</code>	
2	<code>multiplicationTable(5)</code>	

HINT

Keep the outer loop's row total separate from the inner loop's row string — don't reset the overall result inside the inner loop.
