

Problem 6: Primes Under a Limit

Name: _____

Function to write: `primesUnder(limit)`

Write a function `primesUnder(limit)` that returns an array of every prime number less than `limit`. A prime number is greater than 1 and has no divisors other than 1 and itself.

- For every number below `limit`, test whether anything divides it evenly
- Loop from 2 up to (but not including) the candidate number, checking `candidate % divisor === 0`
- A boolean flag (let `isPrime = true`;) that flips to false when a divisor is found works well here

This is the capstone: it combines a nested loop with a conditional to decide what to keep.

```
console.log(primesUnder(10)); // [2, 3, 5, 7]
```

Test Cases — fill in the expected output before you run your code

#	Call	Expected Output
1	<code>primesUnder(10)</code>	
2	<code>primesUnder(20)</code>	
3	<code>primesUnder(2)</code>	

HINT

Numbers less than 2 are never prime — handle that case before running the divisor loop.
